### Notes

#### Quick guide to test results

##### CD4 counts

- Between 500 and 1200 = usual for people who don't have HIV
- Below 200 = there is a higher risk of illnesses and infections

##### Your doctor may give your CD4 results as a percentage

- Above 29% = similar to a CD4 count of above 500
- Below 14% = similar to a CD4 count of below 200

##### Viral load

- Between 100,000 and 1 million = high
- Below 10,000 = for people with HIV not on treatment, this is low
- Below 50 = known as an 'undetectable' viral load. The aim of HIV treatment is to have an undetectable viral load.

### Want to find out more?

#### For more information on this topic

- Read our 'CD4 cell counts' factsheet.
- Read our 'Viral load' factsheet.
- Read our 'CD4, viral load & other tests' booklet.

#### For more information about HIV

- Visit our website [www.aidsmap.com](http://www.aidsmap.com).
- Speak to an adviser at THT Direct (phone: 0808 802 1221).

#### For information in other languages

- Visit [www.aidsmap.com/translations](http://www.aidsmap.com/translations).

#### Has this leaflet been useful to you?

Please let us know what you think. Your feedback helps us to improve the services we offer.

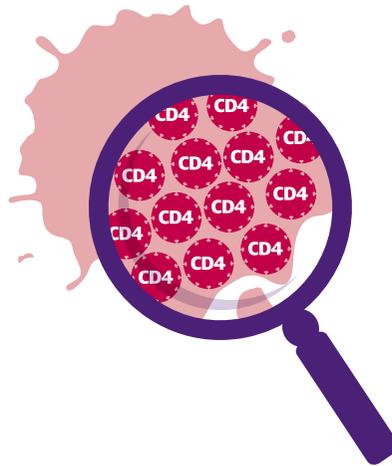

You can contact us to find out more about the scientific research and information we have used to produce this leaflet.

**We recommend that you discuss the information in this leaflet with a doctor or other health worker.**

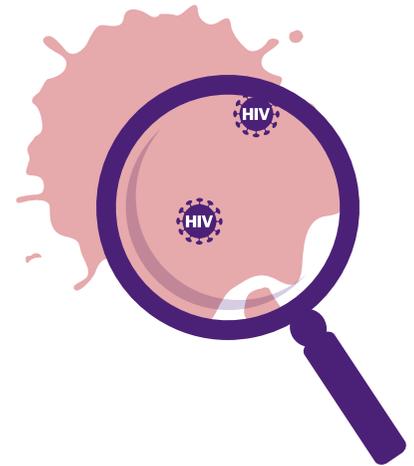

**1** CD4 cells are the most important cells in the immune system. Our immune system protects us against infections and illness.

**2** The CD4 count tells you how many CD4 cells there are in a drop of blood. The more there are, the better.

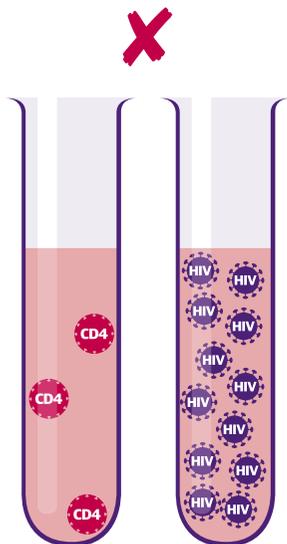

**3** Viral load measures how much HIV there is in a drop of blood. You want to have as little HIV as possible.

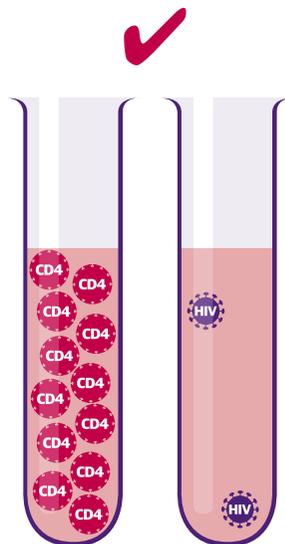

**It's important for all people with HIV to have regular blood tests.**

**The two most important blood tests are for CD4 and viral load.**

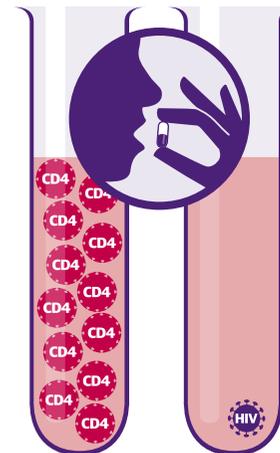

**4** When the CD4 count is low, the viral load is usually high. This situation is not good.

**5** When the CD4 count is high, the viral load is usually low. This is much better.

**6** The result of treatment should be the CD4 going up, and the viral load going right down.

### Important points

- CD4 and viral load test results give essential information about the effect HIV is having on your body.
- The aim of HIV treatment is to have a very low (or 'undetectable') viral load and a high CD4 count.
